

# LPIC-1 100-400 – Lesson 3

**103.3 Perform basic file management**

# Introduction

- The UNIX philosophy:  
**”Everything is a file!”**
- The above statement declares that all objects and structures in the UNIX world, exists in the form of files, or more correctly, file descriptors.

# Copy files with `cp`

- `$ cp file1 file1.bak # backup file1`
- `$ cp ../file1 . # copy file1 from parent directory to current directory`

## Options:

- `-a` # archive (preserve file attributes)
- `-f` # force overwrite destination file, if exists
- `-r, -R` # copy recursively including sub-directories
- `-i` # interactively confirm if you want the destination file to be overwritten

# Create directories with `mkdir`

- `$ mkdir dir1 dir2 # create directories dir1 and dir2`

## Options:

- `-p # create hierarchy of directories, e.g.:`
- `$ mkdir -p ~/dir1/dir2/dir3`
- `-m 750 # create directory with permission 750 (octal)`

# Move/Rename with `mv`

- `$ mv name1 name2 # rename name1 to name2`
- `$ mv ./name1 . # move name1 from the parent directory to the current`
- `$ mv /tmp/name1 ~/name2 # move name1 to your home directory and rename to name2`

## Options:

- `-f # force overwrite destination file, if exists`
- `-i # interactively confirm if you want the destination file to be overwritten`

# Display files/directories with `ls`

- `$ ls # Display files/directories in the current directory`
- `$ ls -la dir1 # detailed view of normal and hidden files and directories in the dir1 directory`
- `$ ls -la .bashrc # whatever starts with "." is a hidden file`  
`-rw----- 1 theo theo 3353 2011-04-29 13:29 .bashrc`

# Display files/directories with `ls`

- \$ ls -la .bashrc
- -rw----- 1 theo theo 3353 2011-04-29 13:29 .bashrc
  - ^ `file type (d for directories) and permissions
  - ^ `number of hard links
  - ^ `owner
  - ^ `group
  - ^ `file size in bytes
  - ^ `datetime
  - ^ `filename

# Display files/directories with `ls`

- `drwxr-xr-x 144 root root 12288 2011-08-22 17:21 etc`  
  ^  
  `the first character of the sequence, declares the file type

Code	Description
-	Regular file
d	Directory
l	Symbolic Link: a file pointing to another file
p	Named pipe: used in inter process communication
s	Socket: used in network inter-communication
b	Block Device: files that represent devices where data flows in blocks larger than a byte, e.g. Hard Disks, CD-ROM, etc
c	Character Device: files that represent devices where data flows in one byte at a time, e.g. terminals, I/O ports, etc

# Display files/directories with `ls`

## Options:

- **-l** # display file in the long listing format
- **-a, --all** # display hidden files as well as normal
- **-R** # recursive listing of files/directories
- **-h** # display size in human readable format, e.g. 3K 24M, 2.3G
- **-d** # display information about directories instead of the content of directories

# Display files/directories with `ls`

- -F # display in this format:  
  “\*/\*=>@|”  
    no symbol is for normal files  
    \*    Executable  
    /    Directory  
    @    Symbolic Link  
    =    Socket  
    |    Pipe

# Delete files with `rm`

- `$ rm file1 file2` # delete (definitively!) file `file1` and `file2`
- Options:
  - `-d` # delete directories when empty
  - `-f` # enforced, non-interactive deletion of files and directories
  - `-i` # interactively warn the user about the deleted files or directories
  - `-r, -R` # recursively delete files or directories

***WARNING! Never try this at home (or at work):***

**`rm -rf /` # deletes everything!**

# Delete directories with `rmdir`

- `$ rmdir dir1 # delete empty directory dir1`

## Options:

- `-p # delete parent and child directories, provided they are empty`

# Show file status with `stat`

- \$ **stat .bash\_history** # shows useful information for files

```
File: .bash_history
Size: 433956          Blocks: 848          IO
Block: 4096  regular file
Device: fd01h/64769d  Inode: 3932171
Links: 1
Access: (0600/-rw-----) Uid: ( 1000/theo)
Gid: ( 1000/theo)
Access: 2018-06-23 08:24:41.811736750 +0300
Modify: 2018-06-22 21:56:36.709083485 +0300
Change: 2018-06-23 08:24:41.811736750 +0300
```

```
# Access: Last Access time
# Modify: Last modification of file content
# Change: Last modification of file attributes
```

# Change timestamps of files with `touch`

- `$ touch .bash_history # change  
datetime with current. As a side-  
effect it creates an empty file  
if the filename does not exist`

## Options:

- `-a # change only the access time`
- `-m # change only the modified time`
- `-t 200302141625 # use different  
timestamp than current. The  
timestamp format is  
[[CC]YY]MMDDhhmm[.ss]`

# Find file type with `file`

- `$ file /bin/bash` # check the type of the `bash` file
- `$ file /etc/fstab`
- `$ file /dev/cdrom`
- `$ file /dev/sr0`

*Note: the file extensions in Linux are optional and not indicative of the actual file type. The file type is determined by analyzing the file data.*

# Process raw data with `dd`

- `$ dd if=/dev/sda of=/media/external/disk.img # clone the disk /dev/sda to image file disk.img`

## Options:

- `conv=lcase` # convert to lower case
- `bs=1024` # set block size to 1024 bytes
- `count=3000` # set the number of blocks the process should last

*Note: if you set the wrong outfile (`of`) you can permanently lose all data on the destination device. Use with caution!*

# Find files with `find`

- `$ find /etc #` find all files under `/etc`
- `$ find / -name fstab #` find file `fstab` under the root directory `"/"`
- `$ find /etc -name "*.cconf" #` find all ending in `.conf` under `/etc`

# Find files with `find`

- `$ find /etc -size +4k #` find files bigger than 4 kB
- `$ find /usr -size -64M #` find files smaller than 64 MB
- `$ find /tmp -size +2k -size -4k #` find files between 2kB and 4 kB
- `$ find /usr -size 6k #` find files between 5.1 kB and 6 kB

# Find files with `find`

- `$ find /usr -type f` # find all normal files under `/usr`

## Options:

- `-type b` # find block devices
- `-type c` # find character devices
- `-type d` # find directories
- `-type p` # find named pipes
- `-type l` # find symbolic links
- `-type s` # find sockets

# Find files with `find`

- `$ find ~ -atime 3 # find files accessed 3 ago`
- `$ find ~ -mtime +3 # find files modified 4 or more days ago`
- `$ find ~ -ctime -3 # find files which status changed 4 or more days ago`

# Find files with `find`

- `$ find /tmp -size -4k -ls #`  
execute `ls -l` on all found files
- `$ find /usr/share -type f -exec file {} \; #` run the `file` command  
on all regular files
- `$ find /tmp -ctime +15 -delete #`  
delete files older than 15 days

# Compress/Decompress files with `gzip` and `gunzip`

- `$ gzip movie.mpg # create a compressed file movie.mpg.gz`
- `$ gunzip movie.mpg.gz # decompress the compressed file to movie.mpg`

## Options:

- `gzip -d # identical gunzip`
- `-r # recursive compression/decompression when dealing with directories`

# Compress/Decompress files with `bzip2` and `bunzip2`

- **bzip2** is considered a more efficient compression method than gzip
- **\$ bzip2 movie.mpg # create compressed archive movie.mpg.bz2**
- **\$ bunzip2 movie.mpg.bz2 # decompress to movie.mpg**

## Options:

- **bzip2 -d** # identical to **bunzip2**
- **-1 .. -9** # **-1** compresses faster but less efficiently and **-9** has a higher compression ration but slow. Default is **-5**

# Compress/Decompress files with `xz` and `unxz`

- **xz** has an even higher compression ration than either bzip2 or gzip
- **\$ xz movie.mpg** # create compressed archive **movie.mpg.xz**
- **\$ unxz movie.mpg.xz** # decompress to **movie.mpg**

## Options:

- **xz -d** # identical to **unxz**
- **-1 .. -9** # **-1** compresses faster but less efficiently and **-9** has a higher compression ration but slow. Default is **-5**

# Archiving with `cpio`

- `$ ls . | cpio -ov > dir1.cpio` # archive the contents of current directory to `dir1.cpio`
- `$ find ~ -mtime +365 | cpio -o > old.cpio` # archive files older than a year
- `$ cpio -iv < dir1.cpio` # extract data from the `dir1.cpio` to current directory

## Options:

- `-o` # create archive
- `-i` # extract from archive
- `-v` # verbose display of data

# Archiving with `tar`

- `$ tar cvf /media/external/backup.tar /home/user # archive home directory to backup.tar`
- `$ tar xvf archive.tar # extract data from archive.tar to current directory`
- `$ tar xvf archive.tar -C dir1 # extract data from archive.tar to directory dir1`

# Archiving with `tar`

- **\$ tar cvzf /media/external/backup.tar.gz ~**  
# archive home directory and compress using **gzip** (**backup.tgz** is another alternative extension)
- **\$ tar cvf /media/external/backup.tar ~ ; gzip backup.tar** # equivalent to the command above
- **\$ tar cvjf /media/external/backup.tar.bz2 ~**  
# archiving and compression using **bzip2** (**backup.tbz2** is an alternative extension)
- **\$ tar cvJf /media/external/backup.tar.xz ~**  
# archiving and compression using **xz** (**backup.txz** is an alternative extension)

# Archiving with `tar`

- `$ tar xvzf /media/external/backup.tar.gz #`  
extract and uncompress with `gzip` of  
`backup.tar.gz` to current directory
- `$ gunzip /media/external/backup.tar.gz ;`  
`tar xvf backup.tar` # equivalent to above
- `$ tar xvjf /media/external/backup.tar.bz2`  
`-C data` # extract and uncompress with  
`bzip2` of `backup.tar.bz2` to the `data`  
directory
- `$ tar xvJf /media/external/backup.tar.xz`  
`-C data` # extract and uncompress with `xz`  
of `backup.tar.xz` to the `data` directory

# Archiving with `tar`

- `$ tar tvzf backup.tar.gz # show contents of backup.tar.gz`

## Options (dashes are optional)

- `-c` # create archive
- `-x` # extract archive `tar`
- `-t` # display contents of archive
- `-v` # verbose output
- `-z` # use `gzip` to (de)compress
- `-j` # use `bzip2` to (de)compress
- `-J` # use `xz` to (de)compress

# Backup to a tape drive with `tar`

- `$ tar --one-file-system cf /dev/st0 / #`  
backup the root directory to the magnetic tape drive `/dev/st0` without leaving the “`/`” filesystem
- `$ tar xf /dev/st0 -c / #` recover the data from the tape to the root directory

"Nobody cares if you can backup, only if you can restore"  
~ Ancient UNIX Proverb ~

"Only wimps use tape backup: *real* men just upload their important stuff on ftp, and let the rest of the world mirror it!"  
~ Linus Torvalds ~

# File Globbing

- The Shell has the option of matching File Names using **wildcards**
- If we want to use the wildcard characters literary they have to be embraced in " " or ' ' or be '**escaped**' using '\'
- The difference between double quotes (" ") and single quotes (' ') is that double quotes return the value of shell/environment variables while single quotes interpret those literary

# File Globbing

Wildcard	Description
*	Match 0 or more characters
?	Match exactly one character
[char]	Match exactly one character, to the characters embraced in square brackets
[!char]	Match exactly one character, to the characters NOT embraced in square brackets
[a-z]	Match exactly one character, to the characters from a to z (lower case)
[!a-z]	Match exactly one character, NOT to the characters from a to z (lower case)
{string1,string2,string3,...}	Match a string with one of the strings embraced in curly brackets

# File Globbing

- `$ ls /etc/*.co*` # matches files names containing .co
- `$ cp /etc/*.c?` . # copy all files which their extension start with c and followed by any single character e.g. `/etc/bogofilter.cf`
- `$ ls -ld .??*` # display all hidden files with at least two characters in their name

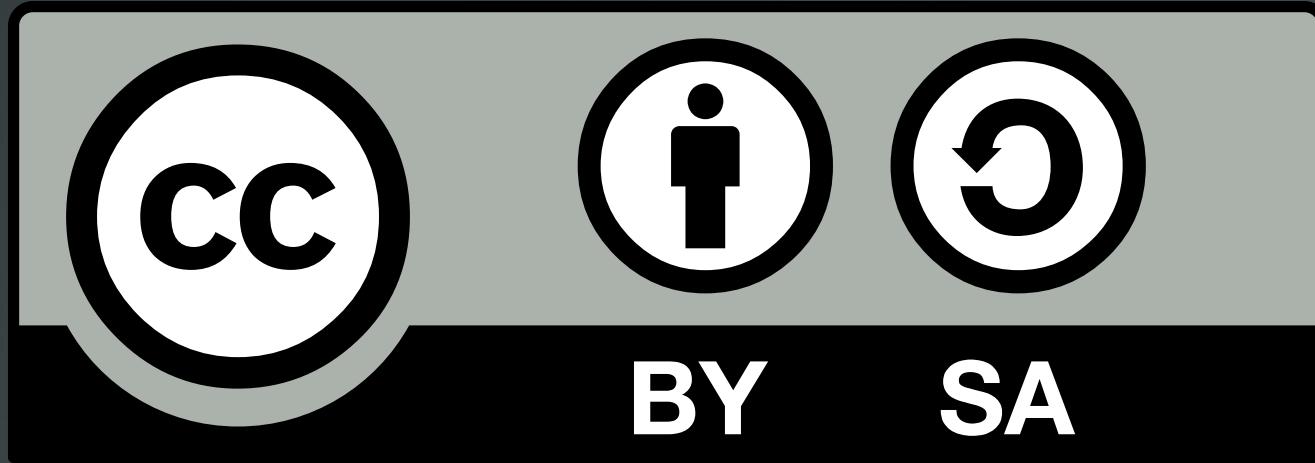

# File Globbing

- `$ mkdir dir with space #` this will create three different directories
- `$ rmdir dir with space #` remove three different directories
- `$ mkdir "dir with space" #` create a directory with spaces in its name
- `$ rmdir dir\ with\ space #` backslash “\” “escapes” and so the whole expression references the directory
- `$ rmdir 'dir with space' #` remove a directory with spaces in its name

# File Globbing

- `$ touch semicolon\; # create file semicolon;` (the `\;` is part of the name)
- `$ rm semicolon\; # delete file semicolon;`
- `$ touch backslash\\ # create file backslash\`
- `$ rm backslash\\ # delete file backslash\`
- `$ echo "my home is $HOME" # print my home is /home/user`
- `$ echo 'my home is $HOME' # print my home is $HOME`
