# LPIC-1 101-400 – Lesson 1

## **103.1** Work on the Command Line (CLI)

# Terminology

- There are many different terms related to the CLI:
  - **Shell**: the command line interface that runs in a terminal to execute commands.
  - **Terminal**: Programs that emulate the behavior of an old school Unix terminal (e.g. VT100)
  - **Console**: Synonym to Terminal

# Examples of Shells

- **bash**: the most popular shell in Linux, default for most systems.
- **bsh**: a simple shell upon which bash was based on
- **dash**: combines the speed of bsh with the functionality of bash
- **csh/tcsh**: inspired from C. Fundamentally different from bash
- **ksh**: merges elements of bsh and csh
- **zsh**:  a feature-rich and powerful shell

# Examples of Terminals

- GNOME Terminal
- Konsole (KDE)
- xterm
- Terminator
- TTYs (Ctrl-Alt-F2 … F6)
- MobaXterm (Windows)
- PuTTY (Windows)
- TeraTerm (Windows)
- Windows Subsystem for Linux - WSL (Windows)

# The Shell Prompt

- **user@hostname: src$**

  The ”$” sign implies non privileged user

- **root@hostname:~#**

  The ”#” sign implies privileged user (root)

- **echo $PS1**

  The $PS1 variable (Prompt String 1) defines the shell form:

  **[\u@\h \W]\$**

  explanation: \u: username, \h:hostname \W:basename

- Additional information:

  **$ man bash** # Lookup PROMPTING

# Basic Command Syntax

- **<command> <command options> <arguments>**
  e.g.:

```
$ ls -la src
total 24
drwxrwsr-x  6 root src  4096 2011-06-21 11:34 .
drwxr-xr-x 11 root root 4096 2011-05-29 14:34 .
drwxr-xr-x  4 root root 4096 2011-05-29 14:34 fglrx-8.840
drwxr-xr-x 24 root root 4096 2011-05-29 14:30 linux-headers-2.6.38-8
drwxr-xr-x  7 root root 4096 2011-05-29 14:30 linux-headers-2.6.38-8-generic
drwxr-xr-x 11 root root 4096 2011-06-21 11:34 virtualbox-ose-4.0.4
```

# Builtins and external commands

- Builtin commands are commands provided by the shell itself, e.g. export, alias, cd etc
- more info: man builtins
- External commands are distinct executable files, e.g. **ls**, **man**, **which**

  more info: **man <command>**
- There are commands that are both external and builtin, like **echo** and **pwd**

  In this case priority goes to builtins

# Basic Commands

- **cd**: change directory
- **pwd**: print working directory
- **echo**: print text/variables in stdout
- **export**: export variables
- **man**: manual pages for commands
- **uname**: system information
- **exec**: Execute a file
- **type**: Show type of command
- **which**: show path of external command
- **exit**: exit current session/shell
- **logout**: exit current session
- **time**: calculate execution time
- **history**: show command history
- **env**: show environment variables
- **set**: show/set variables
- **unset**: unset variables
- **history**: show list of past commands

# Absolute – Relative Paths

- Absolute paths always start with “/”, e.g.:

  **/home/user/bin**

- Relative path start from the current direstory, e.g.:

  **./bin** points to **/home/user/bin** if you are in **/home/user** already

- The dot and slash “**./**” can be omitted, e.g.:

  **bin** points to **/home/user/bin** if you are in **/home/user** already

- A double dot and slash **“../”** is interpreted as “Go back one directory” e.g.:

  **../user2/bin** points to **/home/user2/bin** if you already in **/home/user**

- The tilde character “~” and the variable **$HOME** point to the current user’s home directory (homedir), e.g.

  if the user name is “**user**” then **~/bin** and **$HOME/bin** point to **/home/user/bin**

# Command Execution

- First priority goes to builtins.
- Next priority goes to every executable file in the **$PATH**, e.g.:

```
$ echo $PATH
/home/theo/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/us
r/bin: /sbin:/bin:/usr/games
```

- Directories in the left side are given higher priority than directories in the right, e.g. **/home/theo/bin/ls** has priority over **/bin/ls**
- **$ ls -l /bin/bash**

```
-rwxr-xr-x 1 root root 954896 2011-04-01 00:20 /bin/bash
```

The x character states that the file **/bin/bash** is an executable.

# Command Execution

- For commands not included in the **$PATH** you should explicitly define the absolute or relative path, e.g: **/usr/lib/gettext/hostname** or **./commands/testing**
- The **exec** command can execute other executables
- To execute a command in the current directory we use “**./**” e.g.: **./testing**
- For successive command execution we can use “**;**” e.g.: **<cmd1> ; <cmd2> ; <cmd3>**

# Command Substitution

- We can expand the output of a command to be used as an argument to another command.
- There are two ways to do this:
  **$(command)** or **`command`**.
  The former is recommended as it is safer when there are strange meta-characters in the command
- **`$ echo $HISTFILE`** `# show the file where the command history is saved`
- **`$ ls -l $(echo $HISTFILE)`** `# The` **`echo $HISTFILE`** `command is invoked first and it's output is passed as an argument to the` **`ls -l`** `command.`

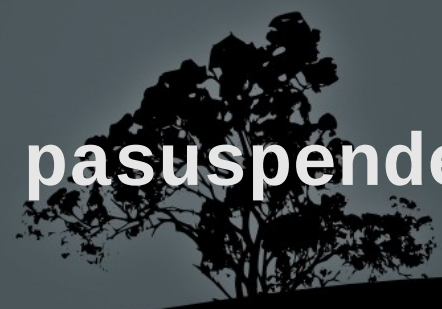
# Command Completion

- Bash as well as other shells provide a "**command completion**" feature by invoking the "**Tab**" key
- A single **Tab** will auto-complete the following characters, provided they are unique:

  **$ pass<Tab> → $ passwd**

- Two successive **Tabs** will display other possible commands, if the set already typed is not unique:

  **$ pas<Tab><Tab> →**
  **passwd paste pasuspender**



# Command Completion

- The same logic applies to paths, e.g.:

```
$ cd /var/lo<Tab><Tab> →
local/ lock/  log/
```

- `$ cd /var/loca<Tab>` →

```
$ cd /var/local/
```

*Note: some systems (like Ubuntu) have extended this concept to options/parameters completion or even the file type expected by the command.*

# Command History

- The **history** command will return a list with the most recent commands
- **$HISTSIZE**: this variable will display the size of the command history
  (default: **1000** commands)
- **$HISTFILE**: this variable will return the command history file
- (default: ~/.bash_history)

# Command History Expansion

- **!!** Executes the most recent command
- **!n** Execute the n$^{th}$ command. We can use the **history** command to see the command numbers.
- **!-n** Execute the n$^{th}$ from the end of the command history.
- **!string** execute the most recent command starting with the characters "**string**".
- **!?string** execute the most recent command containing the characters "**string**".
- **^string1^string2** repeat last command, replacing "**string1**" with "**string2**".
- **$ fc** edits the most recent command history

# Shell Shortcuts

- **Ctrl-p** Go a command back (also ‘Up Arrow’)
- **Ctrl-n** Next command (also ‘Down Arrow’)
- **Ctrl-b** A character backwards (also ‘Left Arrow’)
- **Ctrl-f** A character forward (also ‘Right Arrow’)
- **Ctrl-a** Go to the beginning of a line (also ‘Home’)
- **Ctrl-e** Go to the end of line (also ‘End’)
- **Ctrl-t** Transpose the character left of the cursor with the character under the cursor
- **Ctrl-l** Clear screen but leave the current line to the top of the screen

*Note: The Bash shell has the same shortcuts as the Emacs editor*

# Shell Shortcuts

- **Meta-<** Go to the top of the command history
- **Meta->** Go to the bottom of the command history
- **Ctrl-d** Delete character right of the cursor
- **Ctrl-k** Delete (kill) the text to the end of line
- **Ctrl-y** Paste (yank) the deleted text
- **Meta-d** Delete (kill) the current word
- **Ctrl-rtext** search text backwards
- **Ctrl-stext** search text forward
- **Ctrl-x Ctrl-e** invoke the default text editor

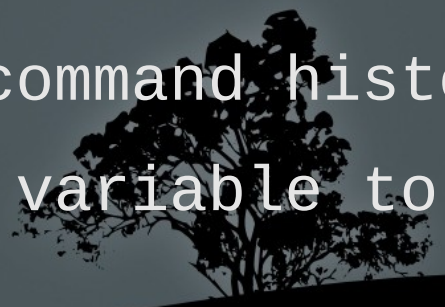
*Note: the ‘Meta’ key is usually assigned to the ‘Alt’ key*

# Environment and Shell Variables

- **$ PROXY=http://proxy.domain.int** # set a Shell variable
- **$ export PROXY** # export a variable to child shells (Environment Variable)
- **$ export PROXY=http://proxy.domain.int** # combine the previous two commands in one

# Commands env, set and unset

- The **env** command will return the list of environment variables:
  `$ env | more # (press q to exit more)`
- The **set** command will return the list of shell variables:
  `$ set | less # (press q to exit less)`
- `$ unset PROXY # unset the variable $PROXY from the Shell and Environment`
- `$ set -o # status of shell options`
- `$ set -o/+o <option> # set/unset shell options`
- `$ set -o vi # use vi shortcuts instead of emacs in the bash shell`
- `$ set +o history # disable the command history`
- `$ set -o allexport # export all variable to the Environment`



# The `uname` command

The **uname** command will return some useful information about our system

- `$ uname -a # display all available info`
- `$ uname -r # kernel release`
- `$ uname -n # machine hostname`
- `$ uname -v # kernel version and info`
- `$ uname -o # os name`
- `$ uname -s # kernel name`
- `$ uname -m # system architecture`

# The `which` and `type` commands

- **$ which set** # no external command named `set`
- **$ $ type set #** set is a builtin command
  set is a shell builtin
- **$ which echo** # path of echo external command
  /usr/bin/echo
- $ **type echo** # `echo` is builtin AND external
  echo is a shell builtin
- **$ type ls** # ls is in fact an alias
  ls is aliased to `ls –color=auto'
- **$ \ls** # run the unaliased version of `ls`

# Getting Help with commands

- Most command support the **-h** or **--help** options (or both) for basic help, e.g.:
- **`$ ls --help`**
- **`$ gzip -h`**
- The **man** will give us a more detailed description of the command, e.g.:

  **`$ man bash`**

- Some command make use of the **info** command for an even more detailed description. **info** supports hyperlinks. Example:

  **`$ info date`**

**”When all else fails, read the manual”**
**~ Ancient UNIX proverb ~**

# Manpages Sections

| Section ID | Description |
|---|---|
| 1 | User Programs and Commands |
| 2 | Kernel System Calls |
| 3 | Library Calls |
| 4 | Devices Files in /dev |
| 5 | File Formats |
| 6 | Games |
| 7 | Various |
| 8 | System commands |
| 9 | Kernel Routines |

# Using the `man` command

- **$ man -wa passwd** # show all man files related to **passwd**
- **$ man passwd** # displays the first of the 3 pages based on the priority: **1:8:2:3:4:5:6:7:9**
- **$ man 1 passwd** # shows the man page related to **passwd** in section **1**
- **$ man 1ssl passwd** # shows the man page related to **passwd** in subsection **1ssl**
- **$ man 5 passwd** # shows the man page related to **passwd** in section **5**
- **$ man -a passwd** # shows successively all man pages named **passwd**
- **$ man -f passwd** # (identical to **whatis**) shows a brief description of all pages named **passwd**
- **$ man -k passwd** # (identical to **apropos**) shows a brief description of all pages containing **passwd**
- **$ man -K passwd** # shows successively all man pages named containing **passwd** in their content
